1. Introduction

The Healthcare Support System is a platform that allows you to consult with doctors online and conveniently address your healthcare needs.

1.1 Purpose

This document provides a brief description of the Healthcare Support System (HSS) to be developed for managing patient data, providing medical support including medical prescription, and facilitating communication between healthcare providers and patients and also integrating doctors, hospitals and patients from remote regions of India

1.2 Scope

The HSS system will allow healthcare providers to manage patient records, appointments, prescriptions, and medical histories. It will also enable patients to access their health information, request appointments, and communicate with their healthcare providers remotely.

1.3 Intended audience:

- Patients
- Doctors

1.4 Glossary:

User	Reviewer or Author.
Patient	A user seeking medical consultations, advice through the platform.
Doctor	A medical professional providing consultations, diagnoses
Prescription	A record of recommended medicines or treatments issued by the doctor
Administrator	Responsible for managing the platform, onboarding doctors

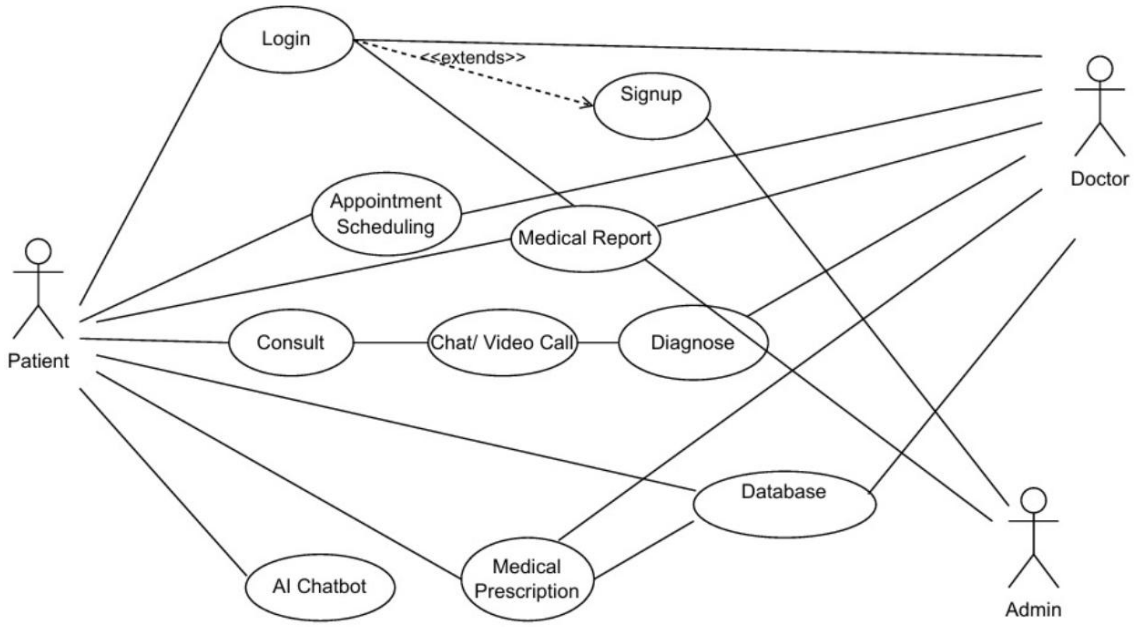
1.6 Overview of Document

This Software Requirements Specification (SRS) document outlines the features and functionalities of the Healthcare Support System (HSS). It starts with an introduction, covering the purpose, scope, and intended audience. The document describes the overall system, including its product perspective and core functionalities such as user registration, real-time communication, and record tracking. It also outlines non-functional requirements like usability, performance, and security, along with external and internal interface requirements, specifying the technologies and architecture. This document serves as a concise guide for developers, stakeholders, and end-users, aiding in the system's design and implementation.

2. Overall Description:

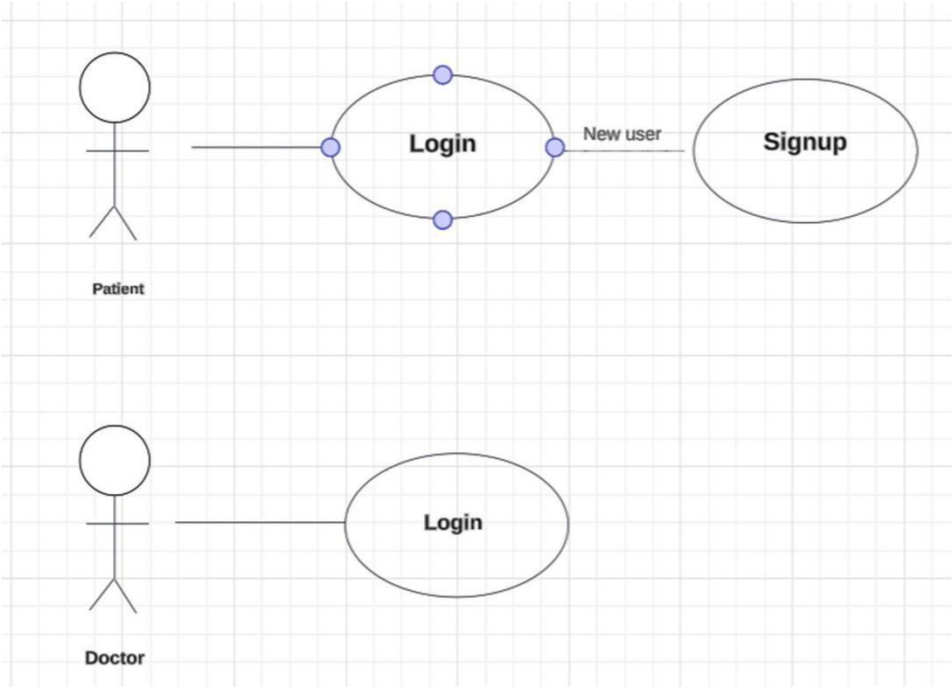
2.1 Product Perspective



The Healthcare Support System is designed to facilitate seamless communication and efficient healthcare management involving three key actors: Doctors, Patients, and an Administrator, supported by an integrated system. Doctors and Patients can communicate in real-time using chat, enabling timely consultations, diagnosis, and follow-ups, making healthcare accessible and interactive. The Administrator plays a vital role in onboarding doctors, ensuring the system is populated with qualified professionals for diverse medical needs.

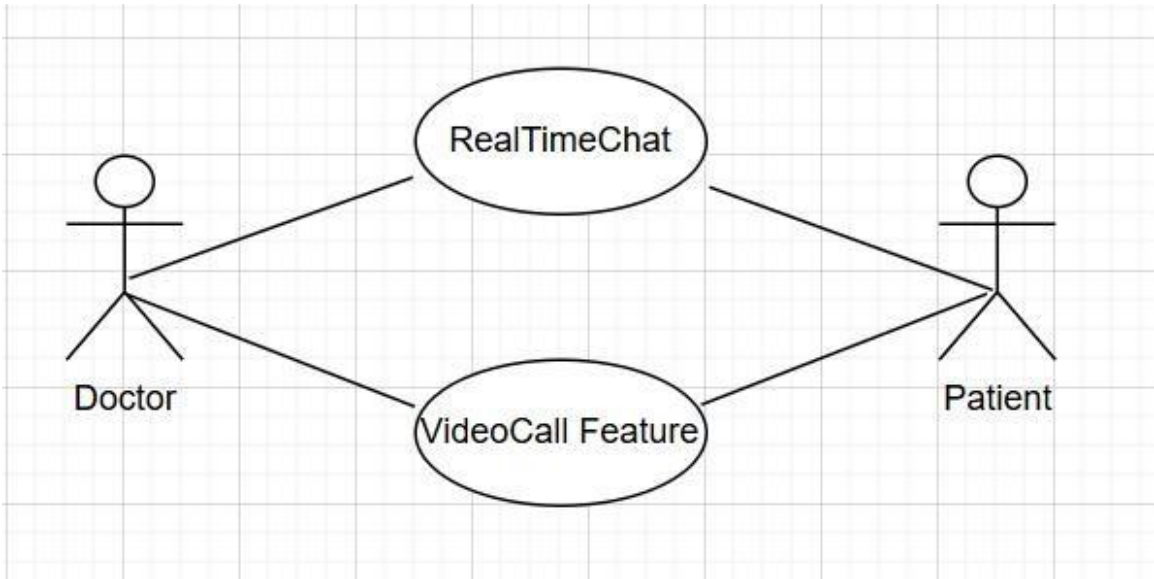
2.2 Functional Requirements:

- **User Registration and Login**



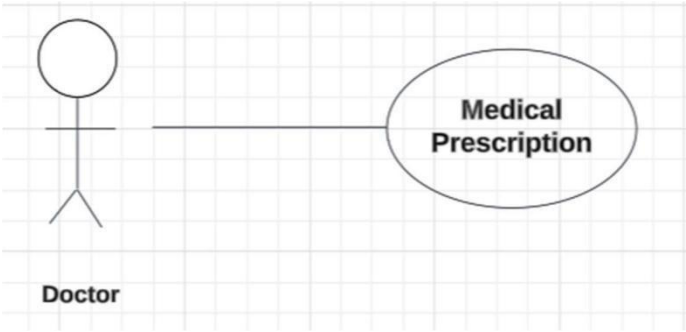
Brief Description: User can register and create account and also can login. Doctor can directly login after getting the credentials from the administrator.

- **Real Time Communication**



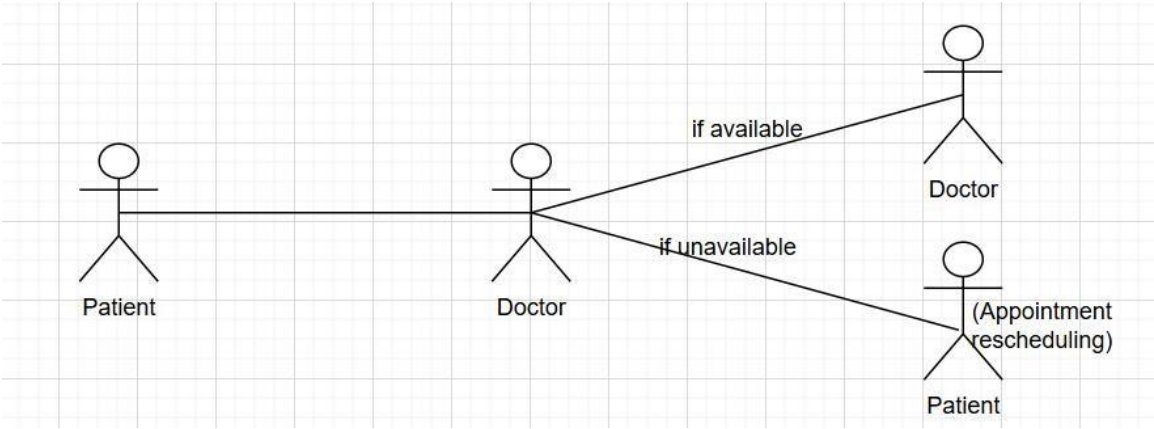
Brief Description: Doctors and patients can engage in real-time chat and video calls, enabling seamless communication for consultations, diagnoses, and follow-ups.

- **Record Tracking**



Brief Description: Stores all patient data digitally, ensuring easy retrieval, updates, and security. Helps doctors track medical history, diagnoses, prescriptions, and treatment plans.

- **Appointment Management**



Manages doctor availability, patient bookings, and appointment rescheduling. Ensures efficient patient flow and prevents overlapping schedules.

- **AI Chatbot**

Provides 24/7 instant assistance to patients and staff, reducing workload on hospital personnel. Answers common medical queries, schedules appointments, and provides triage assistance.

2.3 Non-Functional Requirements:

- **Usability**: Usability refers to how hospital staff, doctors and patients can interact with the system. It ensures a user-friendly interface and seamless navigation. The system should have an easy-to-navigate interface, ensuring that doctors, and administrative staff can access the required features within 3 clicks.

- **Performance**: Performance defines the system's speed, responsiveness, and ability to handle high loads without latency. With approximately 10 users, the system should load patient records, schedules, and reports within 2–3 seconds, ensuring minimal waiting time. A consistent response time is crucial for maintaining workflow efficiency and preventing delays in patient care.

- **Security**: Security ensures patient data confidentiality, access control, and protection against cyber threats. The database remains secure, safeguarding sensitive information from unauthorized access. Different authentication mechanisms are implemented for all users, ensuring that doctors can access medical records but not billing information, while patients can view their reports without modifying them.

- **Scalability**: Scalability ensures the system can handle an increasing number of patients, records, and hospital branches without performance degradation. The HMS should be deployable on cloud platforms like AWS or Azure for on-demand scalability.

- **Functionality**: While functionality is a core system feature, it is also considered a non-functional requirement in terms of completeness, correctness, and reliability of hospital management tasks.

2.4 External Interface Requirements:

- **Frontend**: Next.js,React.js

2.5 Internal Requirements

- **System Architecture**:
  - **Backend**: Node.js
  - **Database**: MongoDB
